Full solutions are available on my.wbs. All exercises are examinable material, not just the ones we covered in the seminars.

Exercise 1

Omitted Variable Bias

Model:

$$\log(wage) = \beta_0 + \beta_1 female + \beta_2 train + \beta_3 educ + \beta_4 exper + u$$

- If less able workers are more likely to be selected and ability is omitted:

True model:

$$\log(wage) = \beta_0 + \beta_1 female + \beta_2 train + \beta_3 educ + \beta_4 exper + \beta_5 ability + \epsilon$$

- therefore $u = \beta_5 ability + \epsilon$
- What can we say about the bias in the OLS estimate of β_2 ?

	$Corr(x_2, x_5) > 0$	$Corr(x_2, x_5) < 0$
$\beta_5 > 0$	Positive Bias	Negative Bias
$\beta_5 < 0$	Negative Bias	Positive Bias

Exercise 1

Bias Direction

- Higher worker ability leads to Higher wages: $\beta_5 > 0$.
- Auxiliary model:

$$\text{ability} = \delta_0 + \delta_1 \text{train} + v$$

- Estimate likely to be $\tilde{\delta}_1 < 0$. i.e. train and ability are negatively correlated (Less able workers are more likely to be selected for training).
- Bias in OLS estimate:

$$\tilde{\beta}_2 = \hat{\beta}_2 + \hat{\beta}_5 \tilde{\delta}_1 < \hat{\beta}_2.$$

- Bias: $\beta_5 > 0, \text{Cov}(\text{train}, \text{ability}) < 0$ implies Negative Bias on β_2
- Conclusion: Negative bias in β_2 , but the magnitude cannot be exactly quantified.

Exercise 1

Collinearity and Interaction Terms

- Dummy variables and perfect collinearity:
 - By definition, $male = 1 - female$.
 - Including both $male$ and $female$ causes perfect collinearity.
 - If there are N dummy variables, include only $N - 1$ to avoid collinearity.
 - Alternative: exclude the intercept term β_0 .
- Interaction term for gender and training program:
 - To test if training effects differ by gender, modify the model:

$$\log(wage) = \beta_0 + \beta_1 female + \beta_2 train + \beta_3 educ + \beta_4 exper + \beta_5 female \times train + u.$$

- This allows different slopes for $train$ by gender.

Roadmap

Exercise 1: Omitted Variable Bias

Exercise 1: Collinearity and Interaction Terms

Part 2: Randomized Experiment

Exercise 2: Randomized Experiment

Part 3: Heteroskedasticity

Exercise 3: Heteroskedasticity Consequences

Part 4: Work vs. Sleep

Exercise 4: Work vs. Sleep

Exercise 2

Randomized Experiment

- Scholarship *randomly assigned*, independent of other factors.
- OLS is unbiased as long as assumptions hold.
 - No change in OLS mechanics or statistical theory.
 - Interpretation of the coefficient differs.
 - With a single regressor, OLS provides an unbiased estimate as long as SLR.1 through SLR.4 hold.

Exercise 2

OLS and Dummy Variables

- Should we add additional controls? Do we have an OVB?

Exercise 2

OLS and Dummy Variables

- Should we add additional controls? Do we have an OVB?
- MLR4 Zero Conditional Mean Assumption:

$$\mathbb{E}[u_i | x_i] = 0 \tag{1}$$

$$\mathbb{E}[u_i | scholarship] = 0 \tag{2}$$

- Is MLR4 satisfied? If not, we have an OVB.
- OVB vs better model fit

Exercise 2: Randomized Experiment

Part 3: Heteroskedasticity

Exercise 3: Heteroskedasticity Consequences

Part 4: Work vs. Sleep

Exercise 4: Work vs. Sleep

Exercise 3

Heteroskedasticity Consequences

Which of the following are consequences of heteroskedasticity?

1. The OLS estimator, $\hat{\beta}_j$, is biased.
2. The OLS estimator is no longer BLUE.
3. The usual t -statistic no longer has a t distribution.

Exercise 4

Work vs. Sleep – Interpretation

- Do men sleep more than women?
 - Male tend to sleep more than females $\hat{\beta}_4 = 87.99$, ($p = 0.011$)
 - At which confidence level can we reject the *null hypothesis* $H_0 : \beta_4 = 0$?
- Trade-off between work and sleep:
 - Statistically significant tradeoff: $\hat{\beta}_1 = -0.166$
 - Strong significance: $t_{\hat{\beta}_1} = -9.23$, $p < 0.001$
 - Intuition: The more you work, the less you sleep.
- Being male and working hard:
 - No effect($\hat{\beta}_5 = -0.042$, $t_{\hat{\beta}_5} = -1.16$, $p = 0.248$).
 - Hardworking men still tend to sleep more than females.
 - The interaction term does not significantly affect the impact of being male on sleep time.
